

10.4 How our energy is produced

1 Energy can be generated from both renewable and non-renewable sources.

- a** What is one example of renewable energy?
- b** What is one example of non-renewable energy?
- c** Why are fossil fuels considered non-renewable?
- d** What is one advantage of wind energy?

UNDERSTAND THESE TERMS

- Non-renewable energy
- Renewable energy
- Fossil fuels
- Wind energy

« RECALL AND CONNECT 2 »

Energy can be generated from the heat under the surface of the Earth (geothermal energy). Geothermal energy is one of the positive impacts of volcanoes. See if you can answer the questions below from [Topic 4, 'Tectonic hazards'](#).

- a** Copy and label Figure 10.3, showing the structure of the Earth.

Figure 10.3: The structure of the Earth

b Identify the plate boundary shown in Figure 10.4.

Figure 10.4: A plate boundary

- c** Describe the hazards associated with the eruption of a stratovolcano.
- d** Are the following statements true or false?
 - i** Oceanic plates are denser than continental plates.
 - ii** Continental crust is thicker than oceanic crust.
 - iii** Continental plates are younger than oceanic plates.
- e** How can buildings be protected from earthquakes?

- ~~2~~ Give **two** differences between renewable and non-renewable energy sources. [2]
- ~~3~~ Why is geothermal energy considered renewable energy?
- ~~4~~ Why can fuelwood be considered either renewable or non-renewable?
- ~~5~~ Justify the use of renewable energy sources. [3]
